

Team Charter — babear

Project Title: Increasing Art Gallery Involvement through SOMO

GitHub Repository: https://github.com/iris0324/babear_deco3500

1. Team Members

Name	Preferred Name	Program	Email
Yunlin Wang	Iris	Master of Information Technology	s4955119@uq.edu.au
Yining Zhu	Ning	Master of Interaction Design	s4905388@uq.edu.au
Binyan Zhang	Zoe	Master of Interaction Design	s4887816@uq.edu.au
Muchu Wang	Muchu	Master of Interaction Design	muchu.wang@student.uq.edu.au
Xinyue Chang	Ivy	Master of Interaction Design	s4937252@uq.edu.au

2. Our Team Approach

Our team includes four Interaction Design students and one Information Technology student. We have different strengths and experience across research, interaction design, technical development, communication and teamwork. We hope to use these differences to support each other throughout the project.

We want to work as one team rather than simply dividing the project into five separate parts. Since our project explores how social and mobile technology can support engagement in physical art galleries, we expect our ideas to change as we learn more through research, discussion, prototyping and testing. Major directions should therefore be discussed as a team rather than decided by one person.

As a team, we do not have a specific grade target. We want to produce the best work we reasonably can without creating unnecessary pressure for each other. We will try to maintain a good standard while also being realistic about everyone's workload and other commitments. We will consider the project successful if we are happy with the final outcome as a team and everyone feels that they have made a meaningful contribution.

We value open communication and shared responsibility. Although everyone has a main area of responsibility, these roles are not strict boundaries. Members are encouraged to give feedback, ask questions, ask for help early and contribute outside their main roles when they have the capacity.

We also see this project as a chance to learn from each other. Everyone has things they are already confident in and things they want to improve. By working together, we hope that the final outcome reflects the contribution of the whole team rather than five separately completed sections.

Yunlin Wang — Iris

Program: Master of Information Technology

Personal Aims and Goals

My personal goal for this course is to improve the skills that I am less familiar with or less confident in, especially design, communication and teamwork. Since every team member has different strengths, I hope to learn from how others think and work and use this experience to identify areas where I can improve.

I also hope to do more than just complete the tasks assigned to me. I want to communicate more actively with my teammates, share my ideas and learn through discussion and collaboration. Through this project, I hope to improve both my professional skills and my ability to work with others.

Assigned Duties

Prepare and maintain the Team Charter, set up and help organise the team GitHub repository, support domain and literature research, and contribute to shared project activities where needed.

Yining Zhu — Ning

Program: Master of Interaction Design

Personal Aims and Goals

My goal is to strengthen my ability to connect research with design practice. Through investigating gallery experiences, existing solutions and stakeholder perspectives, I hope to learn how to identify meaningful research gaps and translate them into design opportunities that can guide our team's decisions.

Assigned Duties

Lead domain and literature research, investigate relevant research and existing solutions, organise useful research evidence, and help connect research findings with the team's design direction.

Binyan Zhang — Zoe

Program: Master of Interaction Design

Personal Aims and Goals

My goal for this semester is to improve my ability to design user-centred social and mobile interfaces, learn professional design strategies for mobile scenarios, and apply these skills to create more intuitive, humanised and socially interactive design experiences.

Assigned Duties

Lead user research and help the team understand gallery visitors' experiences, behaviours, needs and values through interviews, observations and analysis.

Muchu Wang — Muchu

Program: Master of Interaction Design

Personal Aims and Goals

My personal goal for this course is to strengthen my ability to turn research insights into meaningful and feasible interactive experiences. I would also like to improve my understanding of the technical and collaborative aspects of developing social and mobile computing projects.

Through this project, I hope to become more confident in communicating design ideas, working with teammates from different backgrounds, and making design decisions based on user research and evaluation rather than assumptions. I also hope to gain more experience across the complete user-centred design process.

Assigned Duties

Lead interaction and UX design and help translate research findings into interaction concepts and design outcomes, while also contributing to research, prototyping and testing.

Xinyue Chang — Ivy

Program: Master of Interaction Design

Personal Aims and Goals

My goal for this project is to develop my leadership and collaboration abilities by coordinating a multidisciplinary team throughout the design process. I hope to explore how social and mobile technologies can create meaningful connections between visitors in a physical art gallery.

I also aim to expand my experience in technical prototyping and evaluation by transforming our research-based concept into an interactive proof-of-concept and assessing whether it genuinely improves visitor participation and social engagement.

Assigned Duties

Act as the Team Lead and Team Representative, support overall team coordination, and lead technical prototyping and testing. Ivy will also be the main contact person when communication with teaching staff is required.

3. Communication

Our main communication channel is WeChat. We use it for everyday discussion, questions, project updates and meeting arrangements.

GitHub is used to share and store project work and documentation. As backup communication methods, all members also have access to each other's phone numbers and email addresses.

From Monday to Friday, between 9:00 am and 5:00 pm, members should normally try to respond to team messages within one hour. During weekends, members should normally try to respond within three hours.

There is no required response time outside these hours, although members are encouraged to check and respond when they are available, especially when an important deadline is approaching.

If someone knows that they will be unavailable for a longer period, they should let the team know in advance where possible.

4. Meetings

We have two regular in-person team meetings each week:

- Tuesday after class
- Thursday before the studio

Additional online or in-person meetings can be arranged when needed.

There is no fixed meeting chair. During meetings, we will usually go around the group and briefly update each other on what we have been working on, what still needs to be done, and whether anyone has run into problems or needs help. Questions or concerns can then be discussed together.

If a member cannot attend a meeting, they should let the team know beforehand and explain the reason. If they cannot attend in person but are available online, we will try to include them through an online call.

Meeting notes will be taken in rotation and uploaded to GitHub as a `.md` file. The notes do not need to be very detailed, but they should give us a useful record of the main discussions, important decisions, upcoming tasks, deadlines and any problems or blockers that the team should remember.

5. Task Allocation and GitHub

Tasks will normally be discussed and allocated during team meetings. We will consider what the project currently needs, each person's main responsibilities and interests, and everyone's workload and availability.

Members are encouraged to volunteer for tasks. If someone feels that a task or deadline is not realistic, they should raise it during the discussion so that we can work out a better arrangement together.

Each member is responsible for the work they agree to take on and for uploading their own work to GitHub or the relevant shared project location.

In general, a task is considered complete when the work has been finished, checked by the person responsible and uploaded to GitHub or the relevant shared project location. For work that affects other parts of the project, another team member may also review it and give feedback before we consider it finished.

For prototypes and code, we will do appropriate testing before treating the work as complete. The amount of testing may depend on the task and the stage of the project, so we will discuss this when needed rather than following one fixed process for every task.

GitHub Issues will be used where useful for significant tasks or collaborative work that needs to be tracked. Any member can create an Issue, and we do not need to create one for every small task.

Iris has set up the GitHub repository and helps with its basic organisation. We do not have a strict Git workflow at this stage and will use normal team GitHub practices depending on what we are working on. Each member is still responsible for managing and uploading their own work.

6. Deadlines and Workload

Deadlines will normally be agreed on when tasks are allocated. For major submissions, members should try to complete their parts early enough to allow time for the team to combine, review and improve the final work.

If someone thinks they may not be able to complete their work on time, they should tell the team as early as possible rather than waiting until the deadline has passed.

If a member is having difficulty, we can discuss whether they need help, a change in scope, a deadline adjustment or some redistribution of work.

Completing your own task does not mean your responsibility to the team is finished. If another member is struggling or has a heavier workload, members who have capacity should help where reasonable.

7. Decision-Making

Our preferred approach is to make decisions through discussion and consensus.

When we have different opinions, everyone should have a chance to explain their idea and why they think it would work. We will discuss the different options and, where relevant, consider research findings, user needs, feasibility and our overall project goals.

We do not expect every discussion to end with everyone having exactly the same opinion, but we should make sure everyone has had a chance to speak before making an important decision.

If we still cannot reach an agreement after discussing it properly, we will use a majority vote.

Important decisions will normally be recorded in our meeting notes on GitHub so that we can look back at what we agreed on and avoid confusion later.

8. Team Expectations

Everyone is expected to make a genuine effort to complete the work they agree to take on. We want to produce work that we are happy with as a team, but we also understand that everyone has different strengths, workloads and other commitments.

We do not expect every piece of work to be perfect on the first attempt. Members should check their own work and be open to feedback and changes when needed. Feedback should focus on the work and how we can improve it rather than becoming personal criticism.

If someone is unsure about their task or feels that they are falling behind, we would rather they tell the team early so that we can discuss it and help if possible.

Everyone should have an equal opportunity to share ideas and take part in discussions. Differences in program, technical ability, design experience, English ability or background should not be used as reasons to dismiss someone's contribution.

9. Conflict Resolution

We consider the following situations to be team problems when they happen repeatedly or without a reasonable explanation:

- repeatedly not responding to team messages;
- missing meetings without notifying the team;
- not completing work that a member agreed to take responsibility for;
- missing an agreed deadline without communicating beforehand; or
- behaving disrespectfully towards another team member.

For a first or minor issue, we will normally raise it directly through WeChat or during a meeting, understand what happened and try to find a reasonable solution.

If the same problem continues, Ivy, as Team Lead, will speak with the member privately or in another appropriate setting to understand the reason and clarify expectations.

If the issue still cannot be resolved, it will be discussed with the whole team.

We will only contact the teaching team if a serious or repeated issue is affecting the project and our attempts to resolve it within the team have not worked.

If someone is unable to complete their work because of illness, personal circumstances or another reasonable issue, they should let the team know as early as possible and explain the current status of their work. The team can then adjust deadlines or redistribute work if needed.

The main expectation is to communicate problems early rather than letting them build up.

10. Generative AI and Academic Integrity

Any use of generative AI must follow the course requirements and academic integrity rules.

AI can support our thinking, but it should not replace our own thinking. If a member uses AI-generated content or suggestions, they must read, understand and check the material before using or sharing it.

Each member is responsible for the AI-assisted work they contribute and should be able to understand and explain it. Where acknowledgement or disclosure of AI use is required, we will include it.

We will also keep appropriate references for academic literature and other sources. We will not invent or misrepresent interviews, observations, testing results, research findings or other evidence.

11. Updating the Charter

This Charter represents our current team agreement. If part of the agreement is not working well as the project develops, any member can suggest a change.

Changes will be discussed by the whole team and made when the team agrees.

12. Team Agreement

By signing below, we confirm that we have discussed and agreed to this Team Charter and will make a reasonable effort to follow it throughout the project.
